~~PPH~~  
SPECIFICATION

NOVEL FLAVONE C-GLYCOSIDE DERIVATIVES AND  
COMPOSITIONS CONTAINING THE DERIVATIVES

5

TECHNICAL FIELD

The present invention relates to novel flavone C-glycoside derivatives or salts thereof, especially those having anti-allergic effects, and compositions containing  
10 them.

BACKGROUND ART

Recently, various epidemiological surveys have shown an increase in allergic diseases. Cases of pollenosis and  
15 atopic dermatitis, in particular, are increasing to such a degree that they have become a social problem. Increased allergens and changes in our environment such as air pollution, food additives and changes in dietary habits are thought to cause such an increase in cases of allergic  
20 diseases (Itoh, Sōgō rinsyō 41:3099(1992)). Current therapies for allergic diseases basically involve removing or rejecting causal allergens in combination with drug therapy, based on the severity of the symptoms or the pathogenic mechanism of each disease. Allergic reactions  
25 are classified into four types, from type I to IV, based on the causal immunoglobulin and immune cells involved. Type I to III allergies, which are called immediate allergies due to the patient's immediate allergic reaction, are

immunoreactions in which humoral antibodies are involved, while type IV allergy, which is called delayed allergy, is a cell-mediated immune reaction in which sensitized lymphocytes but not antibodies are involved (Tomioka, Sōgō  
5 rinsyō 41:3103 (1992)).

Among these allergic reactions, type I and type IV allergic reactions are thought to be involved in pollenosis and atopic dermatitis, which are treated with antihistamines, basic antiallergic agents or steroids.

10 On the other hand, patent applications which relate to antiallergic agents using oolong tea extracts or epigallocatechin gallate in green tea have been filed (JPA HEI 10-077231, JPA HEI 10-175874, Japanese Patent No. 3023962, etc.). Flavones and their glycosides have been  
15 reported to have the effect of inhibiting histamine release from mast cells or to have an immunosuppressive effect, and are expected to be used as allergy therapies (Kubo M. et al., Chem. Pharm. Bull. 32 : 5051 (1984)). However, most flavones exhibit their effects only at high doses, so that  
20 effective compounds at lower doses are highly desired.

#### DISCLOSURE OF THE INVENTION

An object of the present invention is to isolate/identify compounds having an anti-allergic effect  
25 and to provide novel components capable of treating allergic diseases at low doses and compositions containing such components.

In order to solve the problems above, we focused on

the anti-allergic effect of oolong tea and closely examined its anti-allergic components, and we found that novel flavone C-glycoside derivatives or salts thereof have the effect of inhibiting ear edema formation induced by 2,4-dinitrofluorobenzene (DNFB) and the effect of inhibiting histamine release from peritoneal mast cells. We also found that they can be applied as active ingredients in pharmaceutical compositions, food compositions or cosmetics. Thus, we achieved the present invention.

10

#### BRIEF EXPLANATION OF THE DRAWINGS

FIG. 1 is a graph showing the results of Experimental example 1. Inhibitory effects of compound (1) of the present invention at three concentrations corresponding to oral doses of 0.2, 1.0 and 5.0 µg/kg on mouse ear contact dermatitis as compared with a control group treated with 0.5% sodium carboxymethylcellulose / 0.01N hydrochloric acid are shown.

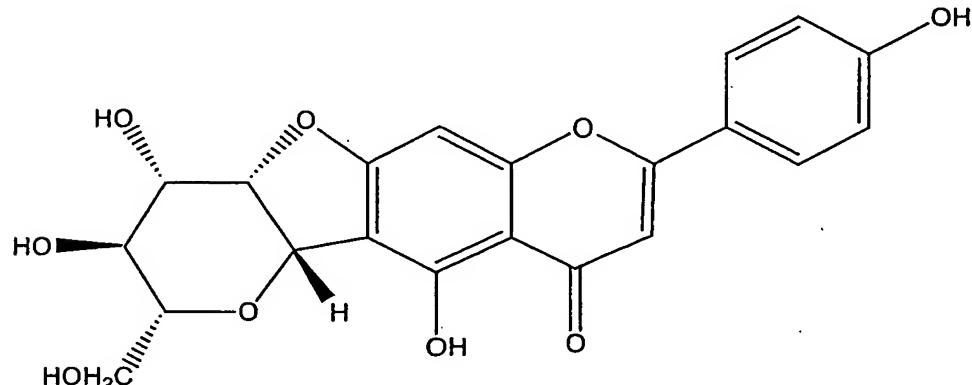

FIG. 2 is a graph showing the results of Experimental example 2. Inhibitory effects of compound (2) of the present invention at three concentrations corresponding to oral doses of 1.0, 10 and 100 µg/kg on mouse ear contact dermatitis as compared with a control group treated with 0.5% sodium carboxymethylcellulose / 0.01N hydrochloric acid are shown.

FIG. 3 shows the structures of flavonoids.

#### THE MOST PREFERRED EMBODIMENTS OF THE INVENTION

As described above, we focused attention on the anti-allergic effect of oolong tea and closely examined anti-allergic components in oolong tea in order to solve the problems above, and we found that novel flavone C-glycoside derivatives or salts thereof have the effect of inhibiting ear edema formation induced by 2,4-dinitrofluorobenzene (DNFB) and the effect of inhibiting histamine release from peritoneal mast cells. We also found that they can be applied as active ingredients in pharmaceutical compositions, food compositions or cosmetics. Thus, we achieved the present invention.

Accordingly, the present invention relates to a flavone C-glycoside derivative of formula (1):

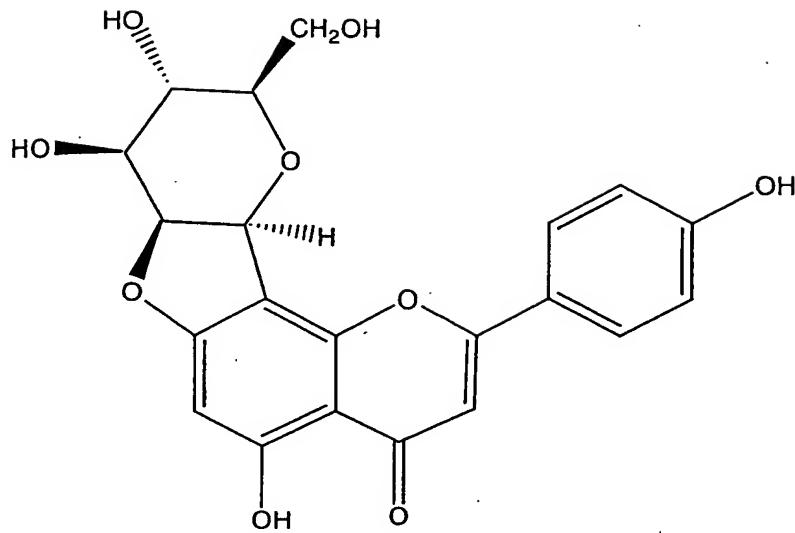

15

or a salt thereof.

The present invention also relates to a flavone C-glycoside derivative of formula (2):

20

or a salt thereof.

The present invention relates to a pharmaceutical  
5 composition for preventing and/or treating an allergic  
disease containing at least one of said flavone C-glycoside  
derivatives or a salt thereof. It also relates to said  
pharmaceutical composition wherein said allergic disease is  
at least one of atopic dermatitis, contact dermatitis or  
10 pollenosis.

The present invention relates to a food composition  
containing at least one of said flavone C-glycoside  
derivatives (1) or (2) or a salt thereof. The present  
invention also relates to said food composition in the form  
15 of any one of dietary supplements or other nutrient drinks,  
healthy drinks, healthy teas or other drinks. It also  
relates to said food composition in the form of any one of  
confectionery, breads, noodles, processed soy products,  
dairy products, processed egg products, fish cakes, fats  
20 and oils or seasonings.

The present invention also relates to a cosmetic containing at least one of said flavone C-glycoside derivatives (1) or (2) or a salt thereof. The present invention also relates to said cosmetic in the form of any 5 one of skin care products, makeup products, hair cosmetics or bath products.

The flavone C-glycoside derivatives of formula (1) and/or formula (2) or salts thereof according to the present invention can be obtained from tea leaves by e.g. 10 extraction with a solvent under heating, concentration and purification using conventional chemical separation/purification means (e.g. fractionation or chromatography).

Tea leaves that can be used for the preparation 15 include leaves of *Camellia sinensis* and/or processed leaves thereof. Especially preferred is oolong tea. Oolong tea is semi-fermented tea primarily produced in the Fujian or Guangdong Province of mainland China or Taiwan.

The solvent used for elution may be either an aqueous 20 solvent and/or an organic solvent, but preferably an aqueous solvent. The aqueous solvent is desirably water, ethanol or methanol. It may also be water alone or any mixed solution of water and a lower alcohol such as methanol or ethanol.

25 The ratio of oolong tea leaves to the solvent at extraction process is not specifically limited, either, but preferably, the weight ratio of oolong tea leaves to the solvent is 2-1000, more preferably 5-100 in terms of

extraction operation and yield.

The temperature at elution process is not specifically limited so long as it is higher than the melting point of the solvent and lower than its boiling point, but is desirably 10°C to 100°C for water or 10°C to 40°C for ethanol and methanol. The extraction period preferably ranges from 10 seconds to 24 hours.

Conventional chemical separation/purification means can be used, such as liquid-liquid distribution, thin-layer chromatography, adsorption column chromatography, partition column chromatography, gel filtration column chromatography, ion exchange column chromatography, electrophoresis and high-speed liquid chromatography. If desired, these separation/purification means can be combined to purify the flavone C-glycoside derivatives of formula (1) and formula (2) or salts thereof at high purity.

The flavone C-glycoside derivatives of formula (1) and formula (2) or salts thereof according to the present invention show an anti-allergic effect so that they can be used for various applications such as pharmaceuticals, foods and cosmetics. For pharmaceuticals, the compounds of formula (1) and/or formula (2) or salts thereof can be used as anti-allergic agents, especially for the purpose of treating atopic dermatitis, contact dermatitis and pollenosis because they show the effect of inhibiting DNFB-induced ear edema formation and the effect of inhibiting histamine release. For foods, they can be added as food additives into dietary supplements or health foods for the

purpose of alleviating or preventing symptoms of atopic dermatitis, contact dermatitis and pollenosis. They can be added to various foods. For drinks, they can be added into dietary supplements or other nutrient drinks, healthy 5 drinks, healthy teas or other drinks. They can also be added into other foods such as confectionery, breads, noodles, processed soy products, dairy products, processed egg products, fish cakes, fats and oils or seasonings. For cosmetics, the compounds of formula (1) and/or formula (2) 10 or salts thereof can be added into skin care products, foundation or makeup products for the purpose of alleviating or preventing symptoms of atopic dermatitis, contact dermatitis and pollenosis.

As for pharmaceuticals, the compounds of formula (1) 15 and/or formula (2) or salts thereof can be orally administered directly or after dilution in water or the like. Alternatively, they can be formulated with known pharmaceutical carriers. For example, the compounds of formula (1) and/or formula (2) or salts thereof can be 20 administered as oral liquid formulations such as syrups or solid oral formulations such as tablets, capsules, granules and powders containing their extracts or powders in combination with pharmaceutically acceptable carriers. Pharmaceutically acceptable carriers include various 25 conventional pharmaceutical organic or inorganic carrier materials and are added as excipients, lubricants, binders or disintegrants in solid formulations or solvents, excipients, suspending agents or binders in liquid

formulations. If desired, pharmaceutical additives such as preservatives, antioxidants, colorants and sweeteners can also be added.

Preferred examples of excipients include lactose,  
5 sucrose, D-mannitol, starch, crystalline cellulose and light silicic anhydride. Preferred examples of lubricants include magnesium stearate, calcium stearate, talc and colloidal silica. Preferred examples of binders include combined cellulose, sucrose, D-mannitol, dextrin,  
10 hydroxypropylcellulose, hydroxypropylmethylcellulose and polyvinylpyrrolidone. Preferred examples of disintegrants include polyethylene glycol, propylene glycol, D-mannitol, benzyl benzoate, ethanol, tris-aminomethane, cholesterol, triethanolamine, sodium carbonate and sodium citrate.  
15 Preferred examples of solvents include purified water, alcohols and propylene glycol. Preferred examples of suspending agents include surfactants such as ethanolamine stearate, sodium lauryl sulfate, lauryl aminopropionic acid, lecithin, benzalkonium chloride, benzethonium chloride and  
20 glycerin monostearate; and hydrophilic polymers such as polyvinylalcohol, polyvinylpyrrolidone, sodium carboxymethylcellulose, methylcellulose, hydroxymethylcellulose, hydroxyethylcellulose and hydroxypropylcellulose. Preferred examples of  
25 preservatives include paraoxybenzoic acid esters, chlorobutanol, benzyl alcohol, phenethyl alcohol, dehydroacetic acid and sorbic acid. Preferred examples of antioxidants include sulfites and ascorbic acid.

Dosage forms are those suitable for oral, parenteral or nasal administration such as tablets or sugar-coated tablets, sublingual tablets, gelatin capsules, troches, suppositories, creams, ointments and skin gels, depending 5 on the type or severity of the disease. The effective dose depends on the age and body weight of the patient, the type or severity of the disease and the route of administrate. The unit dose is generally in the range of 0.0001 to 100 mg/kg, which is administered one to three times in 24 hours.

10 As for foods, the compounds of formula (1) and/or formula (2) or salts thereof can be administered as such or in the form of foods or drinks containing their extracts or powders. They can also be provided as drinks, confectionery, breads, noodles, processed soy products, 15 dairy products, processed egg products, fish cakes, fats and oils or seasonings in combination with conventional materials for foods and drinks and carriers acceptable for ingredients of foods and drinks.

As used herein, drinks includes oolong tea drinks, 20 tea drinks mixed with other tea drinks, carbonated drinks, fruit drinks, lactic acid bacterial beverage, isotonic drinks, soy milk and liquors such as wine, distilled spirit, whisky and sake mixed with oolong tea drinks or other tea drinks.

25 As used herein, confectionery includes biscuits, chocolates, candies, chewing gums, snacks, fried cakes, Western fresh cakes, Japanese traditional cakes, ice creams and jellies.

Processed soy products include bean curd, and dairy products include yogurt and butter. Processed egg products include omelet and pot-steamed hotchpotch, and fish cakes include fish sausage. Seasonings include sauces, dressings, 5 mayonnaise and various fish and vegetables flakes. These can be prepared by conventional processes.

Carriers acceptable for ingredients of foods and drinks include sweeteners such as sugar, glucose, fructose, isomerized liquid sugar, fructooligosaccharides, aspartame, 10 sorbitol and stevia; colorants such as red cabbage dye, grape skin dye, elderberry dye, caramel, gardenia dye, corn dye, saffron dye and carotene; preservatives such as pectin hydrolysate, benzoic acid, sorbic acid, paraoxybenzoic acid esters and potassium sorbate; gelling agents such as sodium 15 alginate, propylene glycol alginate ester, calcium cellulose glycolate and sodium cellulose glycolate; antioxidants such as L-ascorbic acid, tocopherol, erythorbic acid and rutin; color fixing agents such as ferrous sulfate, sodium nitrite and potassium nitrate; 20 bleaching agents such as sodium bisulfite and potassium metabisulfite; quality-keeping agents such as propylene glycol; quality improvers such as L-cysteine hydrochloride and calcium stearyl lactate; leavening agents such as ammonium chloride, potassium hydrogen d-tartrate, ammonium 25 carbonate, potassium carbonate, sodium bicarbonate and alum; emulsifiers such as lecithin, sphingolipids, vegetable sterol, soybean saponin, sodium alginate, propylene glycol alginate ester, sodium caseinate, glycerin

fatty acid ester, sucrose fatty acid ester and sorbitan fatty acid ester; emulsion stabilizer such as sodium chondroitin sulfate; flavors such as lemon oil, eucalyptus oil, peppermint oil, vanilla extract, orange oil, garlic  
5 oil, ethyl acetoacetate, anisaldehyde, ethyl vanillin, cinnamic acid, citronellyl acetate, citral, vanillin, butyl butyrate and esters; health builders such as L-ascorbic acid, L-asparagine, L-alanine, inositol, L-glutamine, carotene, tocopherol, vitamin A, folic acid, iron citrate,  
10 heme iron and uncalcined calcium; flour improvers such as benzoyl peroxide, ammonium persulfate and chlorine dioxide; bactericides such as bleaching powder, hydrogen peroxide and hypochlorous acid; chewing gum bases such as methyl acetyl ricinoleate, ester gum, vinyl acetate resin,  
15 polyisobutylene and polybutene; anti-caking agents such as D-mannitol; binders such as acidic sodium pyrophosphate, potassium pyrophosphate and sodium pyrophosphate; acidifiers such as adipic acid, citric acid, gluconic acid, succinic acid, d-tartaric acid, lactic acid and dl-malic  
20 acid; and seasonings such as seafood extracts, yeast extracts, seaweed extracts, soybean sauce, tomato puree, meat extracts, Japanese sweet rice wine for cooking, fruit purees, boiled and dried bonito flesh, sodium L-aspartate, DL-alanine, L-arginine, L-glutamates, disodium 5'-inosinate,  
25 trisodium citrate, L-glutamic acid, sodium L-glutamate, succinic acid, L-tartaric acid and sodium lactate.

The compounds of formula (1) and/or formula (2) or salts thereof according to the present invention can be

provided directly or after dilution in water or the like or  
after concentration or disintegration or granulation in  
combination with known carriers, in the form of aerosols,  
solutions, extracts, suspensions, emulsions, ointments,  
5 poultices, liniments and lotions. Alternatively, they are  
prepared by appropriately selecting aqueous components,  
surfactants, oily components, solubilizers, humectants,  
powder components, alcohols, pH modifiers, preservatives,  
antioxidants, thickeners, dyes, pigments and perfumes used  
10 in known cosmetics, quasi drugs and drugs. They can also  
be provided in dosage forms for topical skin application  
such as lotions, gels, emulsions and ointments.

As used herein, skin care products include skin  
lotions such as emollient lotion and astringent lotion;  
15 creams such as emollient cream, moisturizing cream and  
massage cream; and emulsions such as emollient emulsion,  
nourishing emulsion and cleansing emulsion.

Makeup cosmetics include face washes, skin cleansers,  
foundations, eye colors, cheek colors and lip colors.

20 Hair cosmetics include shampoos, rinses, hair  
treatment agents, hair creams, hairdressings, hair tonics,  
hair growing agents and hair growth promoters. Bath  
products include bath oils, bath salts and bath foams.

The concentration in foods and cosmetics is not  
25 specifically limited either, but preferably 0.0001-100% by  
weight, especially 0.001-50% by weight expressed as dry  
solids.

The following experimental examples and working

examples further illustrate the present invention without, however, limiting the scope of the present invention exclusively thereto.

5

### EXAMPLES

#### Example 1: Preparation example

Oolong tea leaves in an amount of 5.0 kg produced in the Fujian Province of mainland China were extracted with 100 L of hot water, and the extracts were allowed to cool 10 and then applied on a column packed with 30 L of a synthetic adsorbent (DIAION HP-21, Mitsubishi Chemical). Unadsorbed fractions were applied on a column packed with 30 L of a synthetic adsorbent (DIAION HP-20, Mitsubishi Chemical) and eluted with serially increasing 15 concentrations of ethanol in water (each 60 L) to give 4 fractions [ethanol concentrations = 0% (OHF3N), 20% (OHF4N), 40% (OHF5N), 99.5% (OHF6N)].

Among these 4 fractions, OHF3N fraction showed the strongest inhibitory effect on DNFB-induced ear edema. The 20 formation was concentrated and freeze-dried (517 g) and subjected to countercurrent distribution in a water-n-butanol system ( $n = 7$ ) and the fraction after 7 transfers was concentrated under reduced pressure (2.1 g). Then the resultant was applied on a column packed with Sephadex LH-25 25 (Pharmacia Biotech) and eluted with methanol, and fractions in the range of 1.9-2.2 Kd were collected. The fractions were concentrated under reduced pressure and separated by HPLC on a column SENSHU PAK DIOL-1251 (SENSHU

Scientific, 4.6 x 250 mm) using a solvent hexane : methanol : tetrahydrofuran = 50:35:15 as a mobile phase at a flow rate of 1 ml/min (30°C), and a peak (detected by UV 280 nm) eluted at a retention time of 5.8 minutes was 5 collected. After concentration under reduced pressure, the fraction was purified by HPLC using YMC-Pack ODS-A (YMC, 4.6 x 150 mm). The purified product was collected and then concentrated under reduced pressure to give 980 µg of a pale yellow powder.

10 As a result of structural analysis by spectrometric techniques such as NMR and MS and X-ray analysis (see Table 1 and Table 2), the present compound was identified as a compound of formula (1) [compound (1)] produced by intramolecular dehydration condensation between the 7-OH of 15 Isovitolxin (see FIG. 3) and the 1-OH on the sugar chain.

Experimental example 1: Inhibitory effect on mouse ear

5 contact dermatitis

ICR strain mice at 7 weeks of age were purchased from CLEA Japan and used for experiments after preconditioning for 1 week. The yellow powder obtained in Example 1 [compound (1)] was suspended in 0.5% sodium carboxymethylcellulose / 0.01N hydrochloric acid to prepare sample formulations at three concentrations corresponding to doses of 0.2, 1.0 and 5.0 µg/kg in a dose volume of 10 ml/kg. Infection in six mice per group was established in 5 days by subcutaneous injection of 100 µl of a solution of 1% 2,4-dinitrofluorobenzene (DNFB) in ethanol on the back. On day 6, a solution of 1% DNFB in olive oil was applied on

the right ear to induce ear contact dermatitis. After 24 hours, both ears were punched out in a diameter of 8 mm and weighed. Compound (1) was continuously orally administered for 7 days from the day before the primary challenge until 5 the day on which edema was induced. A control group was treated with 0.5% sodium carboxymethylcellulose / 0.01N hydrochloric acid. The experimental results were expressed as the average percentage of edema on the right in relation to left ears with standard deviation using Student's t-test 10 for evaluating the significance between groups. The results are shown in FIG. 1. As shown in FIG. 1, DNFB-induced edema was significantly inhibited in the groups treated with 1.0 and 5.0 µg/kg of compound (1) as compared with the control group treated with 0.5% sodium 15 carboxymethylcellulose / 0.01N hydrochloric acid.

Experimental example 2: Inhibitory effect on mouse ear contact dermatitis

ICR strain mice at 7 weeks of age were purchased from 20 CLEA Japan and used for experiments after preconditioning for 1 week. The yellow powder obtained in Example 1 [compound (2)] was suspended in 0.5% sodium carboxymethylcellulose / 0.01N hydrochloric acid to prepare sample formulations at three concentrations corresponding 25 to doses of 1.0, 10 and 100 µg/kg in a dose volume of 10 ml/kg. Infection in six mice per group was established in 5 days by subcutaneous injection of 100 µl of a solution of 1% 2,4-dinitrofluorobenzene (DNFB) in ethanol on the back.

On day 6, a solution of 1% DNFB in olive oil was applied on the right ear to induce ear contact dermatitis. After 24 hours, both ears were punched out in a diameter of 8 mm and weighed. Compound (2) was continuously orally administered  
5 for 7 days from the day before the primary challenge until the day on which edema was induced. A control group was treated with 0.5% sodium carboxymethylcellulose / 0.01N hydrochloric acid. The experimental results were expressed as the average percentage of edema on the right in relation  
10 to left ears with standard deviation using Student's t-test for evaluating the significance between groups. The results are shown in FIG. 2. As shown in FIG. 2, DNFB-induced edema was significantly inhibited in the group treated with 100 µg/kg of compound (2) as compared with the  
15 control group treated with 0.5% sodium carboxymethylcellulose / 0.01N hydrochloric acid.

Experimental example 3: Inhibitory effect on histamine release from peritoneal mast cells

20 Wistar strain rats at 7 weeks of age were purchased from CLEA Japan and used for experiments after preconditioning for 1 week. After Wistar strain rats were decapitated under ether anesthesia, Tyrode solution was intraperitoneally injected. Mast cells were routinely isolated and suspended at  $1-3 \times 10^8$  cells/ml in Tyrode  
25 solution containing 0.1% bovine serum albumin (BSA) to prepare a mast cell suspension. The mast cell suspension was incubated with compound (1) or compound (2) dissolved

in 50% methanol at 37°C for 5 minutes. Then, the suspension was further incubated with Compound 48/80 at 37°C for 10 minutes and cooled on ice and then centrifuged. Then, the free histamine content in the resulting supernatant was measured on a high-speed liquid chromatograph by the post-column method using ortho-phthalaldehyde (OPA) according to the method of Onda et al. [J. Med. Sci., 27, 93-97(1978)]. The experimental results were expressed as the percentage of histamine release inhibited by the treatment with the samples as compared with the treatment with the solvent alone. The results are shown in Table 5.

Table 5. Results of histamine release inhibition test

Sample	Concentration ( $\mu\text{g}/\text{ml}$ )	Histamine release inhibition (%)
Compound (1)	5.0	62.3
Compound (2)	50.0	51.2

15 Example 2: Comparison with the effects of a steroid and other flavonoids

The same procedures as in Experimental examples 1 and 2 were used to compare the inhibitory effects of a corticosteroid and several flavonoids (FIG. 3) on DNFB-induced ear edema formation with those of compound (1) and compound (2). The experimental results were expressed as the dose producing a 50% inhibition of DNFB-induced ear edema. The results are shown in Table 6.

Administration of compound (1) and compound (2) showed an inhibitory effect on ear edema formation at very smaller doses than the corticosteroid or other flavonoids.

5      Table 6. Evaluation results of inhibitory effect on ear edema formation

	Dose producing 50% inhibition of ear edema (mg/kg p.o.)
Compound (1)	0.05
Compound (2)	0.17
Dexamethasone	1.5
Apigenin	247
Vitexin	103
Rhamnosyl vitexin	146
Quercetin	265
Rutin	123

Example 3: Preparation example of tablets

Tablets each having a diameter of 10 mm and a weight  
10 of 300 mg were prepared by mixing 150 g of compound (1) obtained in Example 1 with the same amount of lactose and 5 g of magnesium stearate and compressing this mixture using a single stroke tablet press.

15    Example 4: Preparation example of granules

The tablets obtained in Example 3 were ground, granulated and sieved to give granules of 20-50 meshes.

Example 5: Preparation example of hard candies

The following materials were used to prepare hard candies according to a conventional process.

	Sorbitol powder	99.7 g
5	Perfume	0.2 g
	Compound (1)	0.05 g
	Sorbitol seed	0.05 g
	Total	100 g

10 Example 6: Preparation example of chewing gum

The following materials were used to prepare chewing gum according to a conventional process.

	Gum base	20 g
	Calcium carbonate	2 g
15	Stevioside	0.1 g
	Compound (1)	0.05 g
	Lactose	76.85 g
	Perfume	1 g
	Total	100 g

20

Example 7: Preparation example of tangerine juice

The following materials were used to prepare tangerine juice according to a conventional process.

	Frozen concentrated tangerine juice	5 g
25	Fructose-glucose syrup	10 g
	Citric acid	0.2 g
	L-ascorbic acid	0.02 g
	Compound (1)	0.05 g

Perfume	0.2 g
Dye	0.1g
Water	balance
Total	100 g

Example 8: Preparation example of jelly candies

The following materials were used to prepare jelly candies.

Sugar	500 g
10 Starch syrup	500 g
Pectin	13 g
Citric acid	4 g
Sodium citrate	1.5 g
Perfume	1 g
15 Food color	0.2 g
Compound (1)	0.5 g

A mixture of 13 g of pectin and 20 g of sugar was homogeneously dissolved in 330 ml of water. The mixed solution was combined with citric acid and sodium citrate 20 and boiled. The mixed solution was combined with starch syrup and heated to 100°C, and then combined with the remainder of sugar and heated to 109°C. After standing for several minutes, the mixture was stirred with compound (1), perfume and dye and charged into starch molds and dried at 25 50°C or less for 10 hours or more to give jelly candies.

Example 9: Preparation example of fish sausage

The following materials were used to prepare fish

sausage.

	Minced cod flesh	100 g
	Salt	20 g
	Condiment	2 g
5	Egg white	10 g
	Compound (1)	0.5 g
	Minced cod flesh was kneaded with salt, condiment and compound (1) and aged. Then the paste was shaped and steamed in a steamer preheated at about 90-95°C, and then	
10	allowed to cool to give fish sausage.	

Example 10: Preparation example of emollient cream

The following materials were used to prepare emollient cream according to a conventional process.

15	Beeswax	2.0 g
	Stearyl alcohol	5.0 g
	Stearic acid	8.0 g
	Squalane	10.0 g
	Self-emulsifying propylene glycol monostearate	3.0 g
20	Polyoxyethylene cetyl ether	1.0 g
	Perfume	0.5 g
	Preservative	q.l.
	Antioxidant	q.l.
	Propylene glycol	7.8 g
25	Glycerin	4.0 g
	Sodium hyaluronate	0.15 g
	Compound (1)	0.05 g
	Triethanolamine	1.0 g

Purified water	57.5 g
----------------	--------

Example 11: Preparation example of shampoo

The following materials were used to prepare shampoo  
5 according to a conventional process.

	Sodium alkyl ether sulfate	16.0 g
	Diethanolamide laurate	4.0 g
	Propylene glycol	1.95 g
	Preservative, dye, perfume	q.l.
10	Antioxidant	q.l.
	Compound (1)	0.05 g
	Purified water	78.0 g

INDUSTRIAL APPLICABILITY

15 According to the present invention, it was found that novel flavone C-glycoside derivatives contained in oolong tea leaves or salts thereof have a remarkable anti-allergic effect and pharmaceutical compositions, food compositions or cosmetics containing them as active ingredients can be  
20 provided, as described above.
